

Genoa Pump Station Genoa, WI

The fish hatchery at Genoa has several large fish ponds. The Genoa Pump Station was constructed to pump water from the Bad Axe River into the fish ponds. By changing the valving, it is possible to pump water from one pond to the other.

In order to minimize soil correction, a site survey and geotechnical analysis was used to locate the pump station. The intake was constructed on pilings to ensure long term stability.

The project included construction of an intake structure in the Bad Axe River and a 5,000 gpm pumping station. Two 2,500 gpm pumps were installed along with a control system to operate the pumps efficiently. The project included a site survey, preliminary engineering report, and preparation of final plans, specifications, and cost engineering.

Client: US Fish and Wildlife Service
Client Contact: Erin McFadden
Construction Year: 1996
Project Cost: \$445,000
